

CTE Standards Revision Updates

Career Cluster:

Foundations of CTE

Course:

Foundations of Technology

Date:

12/15/15

Description of Change:

An additional indicator (FT7) was added to the revised standards.

The new indicator states: Understand how to create a database table and forms using database software.

Five sub-indicators were added and are listed below:

FT7.1: Create a database table

FT7.2: Create relationships between database tables

FT7.3: Perform queries and filter records

FT7.4: Create forms in a database

FT7.5: Create reports in the database

Reason for Change:

During the standards revision process, the previous database standards were removed from the Foundations of Technology course.

The Department of Education received public comment requesting the database standards be added back into the Foundations of Technology course because there was such a high demand in industry for individuals with database skills.

The standards revision committee reviewed the public comment and determined the database standards should be added back in to the course to assist in meeting industry needs.

Additionally, the revision committee felt it was worthwhile to include the database standards because the Foundations of Technology course is intended to expose students to a wide range of technologies that can be used both professionally and personally.
